

LIVIO PIZZOCCHERO

Curriculum, attività scientifica e pubblicazioni (Italiano)

Curriculum, scientific activity and publications (English)

ITALIANO

Livio Pizzocchero (laureato in Fisica, con lode, nel 1986 e Dottore di Ricerca in Fisica Teorica nel 1990 presso l'Università degli Studi di Milano) dal novembre 2005 è Professore Associato confermato di Fisica Matematica presso il Dipartimento di Matematica dell'Università degli Studi di Milano, dove in precedenza ha prestato servizio come Ricercatore (novembre 1991-novembre 2002) e Professore Associato non confermato (novembre 2002-novembre 2005). Il 17 ottobre 2014 ha conseguito l'abilitazione a Professore Ordinario di Fisica Matematica (Abilitazione Scientifica Nazionale, tornata 2013).

Livio Pizzocchero è affiliato all'Istituto Nazionale di Fisica Nucleare, con incarico di ricerca, e aderisce al Gruppo Nazionale per la Fisica Matematica dell'INDAM. Ha partecipato a progetti di ricerca finanziati dal MIUR e dall'Istituto Nazionale di Fisica Nucleare. Ha svolto l'attività di referee per conto di riviste internazionali di fisica matematica e fisica teorica.

Le pubblicazioni scientifiche di Livio Pizzocchero, elencate di seguito, sono a grande maggioranza articoli su riviste internazionali con referee registrate nei database ISI-Web of Science e Scopus; agli articoli su rivista si aggiunge un libro, pubblicato da un editore internazionale.

Il seguente curriculum contiene una lista delle citazioni raccolte nella letteratura scientifica dalle suddette pubblicazioni.

Nella sua attività scientifica, Livio Pizzocchero ha trattato i seguenti temi di ricerca:

- Teoria delle varietà simplettiche, riemanniane e kähleriane infinito-dimensionali. Uso di questi strumenti geometrico-differenziali in rapporto a questioni fondazionali di meccanica quantistica [2] [3] [4] [5].
- Applicazione degli stessi strumenti alla teoria delle C^* -algebre: costruzione di versioni non commutative del teorema di rappresentazione funzionale di Gelfand [7].
- Struttura differenziale dei tori invarianti per i sistemi hamiltoniani integrabili con spazio delle fasi infinito-dimensionale [1].

- Strutture geometriche ed algebriche fondamentali nella teoria dei sistemi integrabili: formalismo di Lax e bi-hamiltoniano, teoria della matrice R. Applicazioni alle equazioni solitoniche, ai reticoli di tipo Toda e alla teoria del corpo rigido multidimensionale [10] [12] [13] [14] [15] [16] [24] [25].
- Supersimmetrizzazione delle equazioni solitoniche; aspetti generali della teoria dei sistemi integrabili su supervarietà [6] [8] [9] [11] [20].
- Studi di storia della matematica: la geometria differenziale in Italia, con particolare riferimento al periodo tra le due guerre mondiali [17].
- Metodi di approssimazione per funzioni speciali [22].
- Aspetti deterministici e stocastici nei processi con nucleazione e crescita di grani [28] [30].
- Risultati di esistenza su tempi lunghi e stima dell'errore del metodo della media per sistemi integrabili finito-dimensionali perturbati. Applicazioni al moto dei satelliti [27] [31] [32].
- Spazi di Sobolev: disuguaglianze di immersione, stime alla Nash-Moser sul prodotto puntuale di funzioni e sugli operatori nonlineari di composizione con una funzione data (operatori di Nemytskij). Stime sulle migliori costanti in alcune di queste disuguaglianze [18] [19] [21] [26] [36] [38] [46] [48].
- Equazioni di evoluzione semi- o quasi- lineari in spazi di Banach; stime sull'intervallo di esistenza e proprietà di regolarità delle soluzioni esatte, deducibili dall'analisi "a posteriori" di soluzioni approssimate [23] [29].
- Applicazioni dello schema precedente alle equazioni di Eulero o Navier-Stokes: esistenza e regolarità locale o globale delle soluzioni, tramite analisi a posteriori di soluzioni approssimate [34] [37] [39] [40] [41] [43]. Estensione di questo approccio alla magnetoidrodinamica (MHD) [53].
- Approccio rigoroso alla rinormalizzazione in teoria quantistica dei campi: applicazioni all'effetto Casimir [35] [44] [45] [47] [49].
- Teoria della relatività generale: spazi-tempi con curve temporali chiuse [50] e "wormholes" [51] [54].
- Modelli cosmologici che coinvolgono campi scalari [52] [55].

ENGLISH

Livio Pizzocchero (degree in Physics, *summa cum laude*, in 1986 and PhD in Theoretical Physics in 1990 at the University of Milano) is currently Associate Professor of Mathematical Physics in the Department of Mathematics of the Università degli Studi di Milano; on October 17, 2014 he obtained the Italian national habilitation for a Full Professorship in Mathematical Physics (Abilitazione Scientifica Nazionale, tornata 2013).

Livio Pizzocchero is affiliated to the Italian Istituto Nazionale di Fisica Nucleare and to the Italian Istituto Nazionale di Alta Matematica. He took part in research projects sponsored by the Italian Ministry of University and by the Istituto Nazionale di Fisica Nucleare. He served as a referee for several international journals in the areas mathematical physics or theoretical physics.

The scientific publications of Livio Pizzocchero are listed hereafter. Most of them are articles in international refereed journals recorded in the databases ISI-Web of Science and Scopus; in addition to journal articles, a book by an international publisher should be mentioned.

The present curriculum contains the list of citations received by these publications in the scientific literature.

The scientific activity of Livio Pizzocchero has dealt with the following subjects:

- Infinite-dimensional symplectic, Riemannian and Kählerian manifolds: general theory, and applications to quantum mechanics [2] [3] [4] [5].
- Applications of the same geometrical tools to the theory of C^* -algebras: non commutative versions of Gelfand's functional representation theorem [7].
- Integrable Hamiltonian systems with infinite-dimensional phase space, and differential structures for their invariant tori [1].
- Basic algebraic and geometrical structures in the theory of integrable systems: Lax and biHamiltonian formalism, R-matrix theory. Applications to soliton equations, to lattices of the Toda type and to the multidimensional rigid body [10] [12] [13] [14] [15] [16] [24] [25].
- Supersymmetric soliton equations; general aspects in the theory of integrable systems on supermanifolds [6] [8] [9] [11] [20].

- History of Italian mathematics (especially, of differential geometry in the period between the two World Wars) [17].
- Approximation techniques for special functions [22].
- Deterministic and stochastic models for crystal growth [28] [30].
- Existence results over long times and error estimates about the averaging method for perturbations of finite-dimensional integrable systems. Applications to satellite motions [27] [31] [32].
- Sobolev spaces: imbedding inequalities, estimates of the Nash-Moser type on pointwise multiplication and on the nonlinear operators of composition with a given function (Nemytskij operators). Estimates on the best constants in some of these inequalities [18] [19] [21] [26] [36] [38] [46] [48].
- Semi- or quasi-linear evolution equations in Banach spaces: estimates on the interval of existence and regularity properties of exact solutions, derivable from the “a posteriori analysis” of approximate solutions [23] [29].
- Applications of the previous framework to the Euler or Navier-Stokes equations: local or global existence and regularity of the solutions, via a posteriori analysis of approximate solutions [34] [37] [39] [40] [41] [42] [43]. Extension of this approach to magnetohydrodynamics (MHD) [53].
- Rigorous approach to renormalization in quantum field theory; applications to the Casimir effect [35] [44] [45] [47] [49].
- General relativity: spacetimes with closed timelike curves [50], wormholes [51] [54].
- Cosmological models involving scalar fields [52] [55].

Citations of the publications of L. Pizzocchero (last update on September 12, 2016)

The following list has been obtained using mainly Web of Science and Google Scholar. I have excluded citations from papers authored by myself. The list contains some citations from papers by coauthors; in these cases, coauthors have been indicated putting a mark ¶ after their names.

After any citing paper, the expression: “Cit. : [X]” means that the paper cites work [X] in the list of my publications.

Citations are in inverse chronological order, and marked with a counter.
